

# Anthony

**Our son Anthony is five years old and has PDD/NOS. My husband and I strongly agree that this occurred to him as a result from the DPT shot he received. When he received his first DPT, he was very cranky, had a moderate fever, and spent most of the day and night sleeping. When he received his second DPT at five months of age within four hours of the shot he was crying to a point that no one or nothing would console him, he had a fever of 103 and 104, he became very pale, lethargic and at one point his eyes rolled to the back of his head where only the whites were seen, he had no suck and just laid in my arms. I can remember that night as if it were yesterday and I remember looking up towards heaven and asking God not to take my child away from me. It was a horrible experience and we will never forget that night for the rest of our lives.**
