

## 4 Girls Die – India Suspends Cervical Cancer Vaccine

Posted on April 10, 2010 by ChildHealthSafety

India has suspended the HPV cervical cancer vaccine programme after 4 girls died in India amid allegations of exploitation of participants and violation of ethical guidelines during the earlier “clinical trials” of the vaccine according to a front page story in India’s newspaper, The Hindu and widely reported in other media: [Centre halts HPV vaccine project](#) Aarti Dhar Thursday 8th April 2010.

The HPV vaccine has been associated with serious adverse effects with high levels of reported adverse reactions. Death and debilitating illness have been claimed but officials do not acknowledge an association: [Gardasil Victims – In Memoriam – Healthy Young Women – Aged 15 to 21](#).

CHS has previously reported that UK health officials have wrongly assumed the human papilloma virus (HPV) vaccine can prevent 70 per cent of cases of cervical cancer and media have reported that “*German experts said the assumptions simply did not stand up to scrutiny, and that women remained at risk*”: [Experts Cast Doubt on Claim for ‘Wonder’ Cancer Jabs](#) Sunday Express 31 May 2009: [Cervical cancer jabs cast into doubt after experts question effectiveness](#) Scotland On Sunday 10th May 2009.

The drive for mass vaccination programmes internationally is the result of the drug industry’s changing business plans from the failing blockbuster patented drug model to hugely lucrative mass multiple vaccinations for the world’s 6.5 billion people. But those who raise valid public and child health safety concerns are routinely ‘label libelled’ as ‘anti-vaccine’, ridiculed and in the case of some medical professionals, hounded out of their jobs.

Germany’s Robert Koch Institute, which makes recommendations on the public funding of vaccines, had to review the nation’s programme in May 2009 after 13 experts called for a reassessment of its HPV vaccination programme and an end to “misleading information” about the effectiveness of the jab. A spokeswoman said: “Because of the public discussion and some new reports and new statements from the 13 professors, the committee will publish a statement within the next few weeks.”

Dawn Primarolo MP for Bristol South since 1987

The UK’s New Labour Government has been aggressively pursuing the HPV vaccine programme in schools out of sight of parental control: [HPV Vaccine Questioned Internationally](#) CHS 31 May 2009.

Some consent forms reportedly had no decline option. There have been anecdotal reports of young girls being cross-examined in school corridors by health officials on parental consent issues. British Health Minister Dawn Primarolo is closely associated with the pursuit of the policy.

The Sunday Express reports Professor Martina Doren, of the Charitie Hospital in Berlin:

What concerns us is that the two manufacturers of the vaccine aren’t always using facts. They claim that a lot of high-risk strains of cancer-causing virus are protected against but equally there are others that are not. If protection is not more than 20 per cent then that is an awful lot of money to be spending, particularly as the vaccines have quite serious side-effects.”

[EXCLUSIVE: EXPERTS CAST DOUBT ON CLAIM FOR 'WONDER' CANCER JABS](#) – By Lucy Johnston and Martyn Halle – Sunday May 31,2009

A spokesman for GlaxoSmithKline, which makes Cervarix, was unable at the time to provide figures on cases of pre-cancerous cells in women who have taken the vaccine, compared with those who have not. Scottish Conservative health spokeswoman Mary Scanlon said at the time: “Given this new research, it is now incumbent on the Scottish Government and the chief medical officer to review the vaccination programme to ensure that it lives up to the expectations of preventing cervical cancer.”

The HPV vaccine programme is based on recommendations of the UK’s Joint Committee on Vaccination and Immunisation. This highlights questions over the competence of the UK’s JCVI to make recommendations on UK vaccination programmes and the competence of medical professionals in general to express opinions on scientific matters.

The JCVI has a documented history of recklessness over vaccination policy and a needle-happy reputation along with concerns about financial and other conflicts of interest: [Secret British MMR Vaccine Files Forced Open By Legal Action](#) but from April 1 last year has been given unfettered control of UK Government vaccination policy for England: [UK Government Hands Drug Industry Control of Childhood Vaccination](#). And as the British Medical Journal confirms: [Doctors are not scientists — Smith 328 \(7454\): BMJ](#).

If the vaccine is not effective, then its adverse effects cannot be justified but in the UK we see no official comment on the vaccine’s risk profile. This highlights how public safety issues fail to be addressed as a result of what some claim is a quasi-religious belief created by the drug industry in the importance of vaccines and the fear medical professionals have of making public criticisms on safety grounds.

Alongside the expansion of vaccination programmes the childhood prevalence of lifetime conditions like asthma, allergies, autism, diabetes and others requiring further medications have increased substantially.

The Bill Gates’ Microsoft type business model is one of the emerging replacement business models for the drug industry. Almost everyone has Windows software on their PC – almost everyone will be vax’ed. Gates quickly became a multi-billionaire. With vastly more people to vaccinate than computers requiring software the lure of money for the pharmaceutical industry is substantial.
