VACCINATION SPREAD DISEASE

"Arm-to-arm vaccination was nothing less than the universal distribution of all the diseases of humanity broadcast over the nation."

J.T. Biggs (Sanitary Engineer)
[1912] LEICESTER: SANITATION versus VACCINATION
whale.to/a/biggs1.html whale.to/a/arm.html

Vaccination Act of 1898 finally prohibited arm-to-arm vaccination.

"At least three-fourths of the lymph in use in the United Kingdom was the variety known as arm-to-arm vaccination virus."--William Tebb (1887)

VACCINATION SPREAD DISEASE

"With vaccinations over 90 per cent, of the births, the zymotic death-rate rose to the enormous figure of 6,852 per million! There is but little vaccination in Leicester now, no small-pox, and the death-rate from these seven principal zymotics has fallen in 1908-10 to the almost incredibly low figure of only 1,153 per million!!! What has achieved this astounding revolution? Certainly not vaccination. It is the direct outcome of active, persistent, and solid progress in sanitation, which, in its broadest sense, covers the entire exclusion of the absolutely insanitary and disease-diffusing practice of cow-poxing.....In other words, our improved sanitation, and rejection of vaccination, are saving nearly 1,400 lives annually from the zymotic group of diseases alone!"

J.T. Biggs (Sanitary Engineer)

[1912] LEICESTER: SANITATION versus VACCINATION
whale.to/a/biggs1.html

Seven principal zymotic diseases: Smallpox, Measles, Scarlet Fever, Diphtheria, Whooping Cough, Fevers, Diarrhoea.

ALLOPATHY OPPOSED SANITATION REFORM

"Sir Henry Littlejohn, of Edinburgh....told the Congress at Exeter that the medical profession had all along shown the strongest opposition to sanitary reform. This declaration provoked indignant protests, but Sir Henry retorted that they knew it was true, and it ought to be made known. Of course, Sir Henry spoke as a Medical Officer of Health."

HIDING VACCINE DEATHS (DIAGNOSIS LIE)

"In passing, it is significant to note that this official inquiry elicited the fact that these six little victims of vaccination had all been buried under misleading death certificates, no word as to vaccination appearing on any of those documents. That practice of 'preserving vaccination from reproach' is believed to be common, and if the suspicion be well founded, it shows how our national vital statistics are considerably vitiated and the public deceived."

LEICESTER: NO ALLOPATHIC FEARMONGERING

"There is still another aspect which also redounds to the good sense of the people of Leicester. Whenever an outbreak of small-pox occurs, there is an entire absence of 'panic' (excepting in the 'protected' circles) such as usually occurs in efficiently vaccinated towns. No flaming posters are placed upon the walls to create alarm and excitement. The Sanitary authorities go about their work in a quiet, unostentatious (but, withal, thorough) manner, and this inspires confidence in the minds of the people, and at the same time allays their fears. Whatever stir or attempted scare occurs is outside the Borough, usually in medical publications, whose business, for many years, has been to fruitlessly endeavour to detract from the splendid results in dealing with small-pox which have been achieved by Leicester."

LEICESTER vs. VACCINATED SHEFFIELD

"It does not redound to the credit of the medical journals that while they tried their utmost to arouse a scare throughout the country against 'unprotected' Leicester, which had only a few cases of small-pox in 1887 and 1888, and these traceable to Sheffield, they were practically silent about the 7,000 cases and nearly 700 deaths which occurred at efficiently vaccinated Sheffield."

VACCINE 'LYMPH' & THE VACCINATION METHOD (1882)

"A...Local Government Board Inquiry was held, in 1882, at Derby, by Dr. P. W. Barry, owing to the death of a child following vaccination. It was found that he had used a lancet 'without a point, rusty and dirty; the vesicle opener also rusty and dirty.' One of the tubes was coated inside with 'albuminous matter'; others contained 'opaque lymph', and one 'a little blood.' Some tubes were not even sealed, but contained 'opaque lymph, slightly bloody.' It was reported that the 'septic infection' was inoculated into the child 'from some dirty appliance' used by this model (!) Public Vaccinator."

J.T. BIGGS (Sanitary Engineer)

Author: [1912] LEICESTER: SANITATION versus VACCINATION

"Jenner got some of the 'cowpox' and inoculated it into someone's arm - it fostered and the pus was then inoculated into someone elseHow absurd - complete with all sorts of germs including hepatitis, syphilis and whatever. If one did that today, without antibiotics, the death rate would be huge." ---Dr Archie Kalokerinos M.B.B.S

"It was found that he had used a lancet "without a point, rusty and dirty ; the vesicle opener also rusty and dirty." One of the tubes was coated inside with "albuminous matter" ; others contained "opaque lymph," and one "a little blood." LEICESTER VACCINATION DEATHS

"When we pinned our faith to...vaccination—from 1868 to 1872—no fewer than an annual average of 239 out of every 1,000 infants born died within twelve months of their birth. Now, having seen the error of our ways, and discarded the nostrum, instead of 239 deaths, there is only an annual average of 128 deaths per 1,000 births, or a decrease of 111 per thousand, being a saving of 46 per cent. These figures represent an annual saving of over 600 infant lives each year in Leicester.

The saving of children's lives under five years of age is on the same lines of progress. Whereas in the high vaccination period of 1866-72 there were 107 deaths per thousand living at that age, now there are only 34 per thousand, being a decrease of 73 per thousand, or a saving of 68 per cent. This represents a saving of over 2,200 lives each year of children living under five."

J.T. BIGGS (Sanitary Engineer)

Author: LEICESTER: SANITATION versus VACCINATION (1912)

[J.T. Biggs](#)

LEICESTER

"The town of Leicester is, and has been for the last twenty years, the least vaccinated town in the kingdom. Its average population from 1873 to 1894 was about two-thirds that of the Army during the same period. Yet the small-pox deaths in the Army and Navy were thirty-seven per million, those of Leicester under fifteen per million."

J.T. Biggs (Sanitary Engineer)

[1912] LEICESTER: SANITATION versus VACCINATION

whale.to/a/biggs1.html

[J.T. Biggs](#)

"Pro-vaccinists regarded it as a thing impossible and incredible that unvaccinated Leicester could, for even one year, much less for so long a period of years, successfully resist repeated and numerous attacks of small-pox. But such is now a stubborn, unimpeachable, and accomplished fact."

J.T. Biggs (1912)

"Whereas in the high vaccination period of 1866-72 there were 107 deaths per thousand living at that age, now there are only 34 per thousand, being a decrease of 73 per thousand, or a saving of 68 per cent. This represents a saving of over 2,200 lives each year of children living under five."

J.T. Biggs (1912)

"Pock-marked faces depend, not upon vaccinal condition, but upon the treatment of the patients, and their occurrence after small-pox is a proof of inefficient medical knowledge and improper nursing, or both combined. The less, therefore, said about the absence of pock-marked faces being due to, and an argument in favour of, vaccination, the better. The facts entirely refute the validity of such a claim."

J.T. Biggs (1912)

"The fact that with less vaccination the town enjoyed better health, and the coincident decline of vaccination and small-pox, had great effect on the minds of the people of Leicester. Not small-pox alone, but the infantile death-rate, the whole of the zymotic (infectious) diseases, and the general death-rate, all declined in a very marked degree, as vaccination was discarded."

J.T. Biggs (1912)

"Our improved sanitation, and rejection of vaccination, are saving nearly 1,400 lives annually from the zymotic (Small-Pox, Measles, Scarlet Fever, Diphtheria, Whooping Cough, Simple Fevers, and Diarrhoea) group of diseases alone!

J.T. Biggs (1912)

"Of 587 men vaccinated, no fewer than 166, or more than 28 per cent., actually went on the sick list as the result of vaccination.....The men were of the strongest possible physical type....what must be the possibilities of its effects on tender infants, or persons of weakly constitutions?...If these facts were placed before parents, there are very few who would venture to submit either themselves or their children to the 'propitious' influence of such "carefully prepared glycerinated calf lymph."

J.T. Biggs (1912)

In passing, it is significant to note that this official inquiry elicited the fact that these six little victims of vaccination had all been buried under misleading death certificates, no word as to vaccination appearing on any of those documents. That practice of "preserving vaccination from reproach " is believed to be common, and if the suspicion be well founded, it shows how our national vital statistics are considerably vitiated and the public deceived."

J.T. Biggs (1912)
