The Case Against Vaccination - Beddow Bayley

The same applies to the development of vaccination¹ and all the fundamental drugs like digitalis, strophanthin, atropine, iodine, quinine, nitro-glycerine, radium, penicillin. Not one single important therapeutic discovery is due to vivisection, whereas books can be filled with the cases where animal experimentation has indisputably spelled disaster for humanity, besides misleading or retarding clinical research."

([Hans Ruesch](#), **Slaughter of the Innocent**, page 198, also M. Beddow Bayly, M.R.C.S., L.R.C.P., **Clinical Medical Discoveries**.)

A glimpse at the overwhelming evidence from medical practitioners reveals the falsity of claims made in [Animal Research Saves Lives](#) that life-saving surgical techniques were founded on vivisection. As shown in **Clinical Medical Discoveries**, Dr M. Beddow Bayly documents the many surgical advances which owing nothing to vivisection but were discovered and pioneered through clinical research. These advances being supremely valuable to the benefit of human beings and animals it is the practice of those who set out to support and defend vivisection, and their jobs, to distort historical facts and thereby create the impression in the minds of the public that such advances were the result of vivisection. Dr Beddow Bayly, in dispelling these claims also outlines the inadequacies and grossly misleading results arising from vivisection. His views are openly shared by hundreds of medical doctors whose opinions are concisely documented in [Hans Ruesch's One Thousand Doctors \(and many more\) Against Vivisection](#).

Dr Fadali's evidence is borne out by medical historian Dr M. Beddow Bayly in **Clinical Medical Discoveries** who writes:

"As for bypass surgery, animal research actually retarded this therapy for humans. Because a dog's clotting characteristics and coronary valves are so different from ours, the initial human patients died. The first success was Dr Kunlin's work in France. Dr Kunlin's work was clinical and had nothing to do with animal research."

Beddow Bayly, author of the book "The Case Against Vaccination" said: "After vaccination was introduced, cases of aseptic meningitis were more often reported as a separate disease from polio, but such cases were counted as polio before the vaccine was introduced. The Ministry of Health admitted that the vaccine status of the individual is a guiding factor in diagnosis. If a person who is vaccinated contracts the disease, the disease is simply recorded under a different name." (6)

"The subject of Vaccination, ... is, fortunately, one on which anyone capable of appreciating figures can form a sound opinion."

M. BEDDOW BAYLY M.R.C.S., L.R.C.P.

"Dr. Louis Parkes, Chairman of the Council of the Royal Sanitary Institute, declared in 1922: "Our freedom from smallpox, therefore, could not be attributed to vaccination. It was largely due to the preventive measures taken at the ports, to the isolation of cases in hospitals, and to the steps taken to control persons who had been exposed to infection."

M. BEDDOW BAYLY M.R.C.S., L.R.C.P.

"The more it (vaccination) is supported by public authorities, the more will its dangers and disadvantages be concealed or denied."

M. BEDDOW BAYLY

"Compare these well vaccinated countries with Australia, the least vaccinated country in the world. In 134 years, not one-fifth of the children born have been vaccinated. Yet only three Australian children under five have died of that disease. In the last 50 years, no child under five has died of smallpox, and in the whole of her history, less than one person per annum has died of it, although allowing five years protective period, only 2 per cent, of her population have ever been "protected."

M. BEDDOW BAYLY M.R.C.S., L.R.C.P.

"It would seem to be impossible for a rational mind to conceive that a filthy virus derived from a smallpox corpse, the ulcerated udder of a cow, or the running sores of a sick horse's heels, and cultivated in scabbed festers on a calf's abdomen could fail to have disastrous effects when inoculated into the human body. As Professor McIntosh remarked in the Lancet in 1926, 'Scientifically it cannot be disputed that from every point of view the injection of virus capable of multiplying in the body of the individual is bad.'

M. BEDDOW BAYLY M.R.C.S., L.R.C.P. (1936)

"The Chief Medical Officer of the Board of Education, SIR GEORGE NEWMAN, has described the procedure as a 'safe, practical and efficient method of protection.' ...No reference to the disasters which have been recorded in various parts of the world, nor to the severe reactions which are a frequent sequel to the inoculation, is made in these official statements."

M. BEDDOW BAYLY M.R.C.S., L.R.C.P. (1939)

"Dr. Thomas Francis did not mention in his key evaluation of the 1954 Salk field trials that those who contracted polio after their first inoculation and before their second inoculation were placed in the 'not-inoculated' list."

M. BEDDOW BAYLY M.R.C.S., L.R.C.P. (1939)

"In the British Medical Journal, June 5th, 1937 (p. 1182) will be found an account of the death of a Waterford girl, aged 12, and the illness of 23 other children, tuberculosis having developed following the inoculation of Toxoid Antitoxin Floccules."

M. BEDDOW BAYLY M.R.C.S., L.R.C.P. (1956)

"Dr. R. V. Southcott (Med. Jour. Aust. 1953. ii. 281) believes that a child whose tonsils were removed at the usual age of 5-7 yrs suffers trauma to the nerves of the pharynx which increases susceptibility to bulbar poliomyelitis for at least ten years. In an outbreak in South Australia in 1947-48 he found that in 35 out of 39 cases of bulbar poliomyelitis the patient had been tonsillectomised."

M. BEDDOW BAYLY M.R.C.S., L.R.C.P. (1956)

SUBJECT: PHOTO ENLARGEMENT OF A CHILD WHO DIED FROM VACCINE POISONING--DEAD BABY 1

Fig. 1 Photo by permission of Dr. Bedow Bayly of London. This is one of the many deathbed cases of vaccine poisoning. The skin and part of the flesh rotted off the lower back and upper legs of this previously healthy baby. No medical treatment was able to cure or relieve this condition of medical poisoning.
